

Dear Prospective Business Partner,

It is with great enthusiasm that we introduce you to Lumière Light Thérapie, an exciting offering resulting from the collaborative efforts between Photo Therapeutics Limited (PTL) and Raymond Anthony International (RAI). In developing Lumière Light Thérapie, the collective experience and expertise of both organizations has been leveraged to create a truly exceptional offering that is dramatically changing the complexion of the beauty services industry.

What is today Lumière Light Thérapie began with the pioneering efforts of Dr. Colin Whitehurst, MD, PhD whose research stems back to the early 1980's as a laser oncologist at Christie Hospital in the United Kingdom. In an effort to identify a novel, less traumatic means to treat skin cancer, Dr. Whitehurst experimented with Photo Dynamic Therapy (PDT) using a first-of-its kind LED light source that he developed. Called the Paterson Lamp, the device utilized spectrally pure, low intensity red light and proved to be highly effective for PDT of non-melanomic skin cancer. Many of the cancer patients undergoing treatment with the Paterson Lamp were also observed to experience significant improvements in skin tone and texture in the areas surrounding the cancer lesion. Based upon this observation, further research was conducted leading to the confirmation of the rejuvenating effects of LED red light on the skin.

Continued studies resulted in significant findings, the creation of an impressive portfolio of intellectual property, and ultimately the awarding of more than one dozen patents related to the LED device developed by Dr. Whitehurst. When PTL was founded to further the application of his discoveries for an expanding range of purposes, Dr. Whitehurst joined to head the company's research and development team and shortly after, OMNILUX was launched. Today, OMNILUX is utilized by physicians worldwide for an ever-expanding range of applications including wound healing, scar reduction, pain management, and treatment of medical skin conditions such as vitiligo and rosacea.

Developed from the core technology of OMNILUX, the Lumière Light Thérapie device has been specially modified to allow for "cosmetic-only applications" approved for delivery in non-healthcare environments. It is an effective, safe and convenient system that provides significant business benefits to any skincare practice.

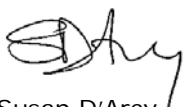

Raymond Anthony International is a leading developer of prestige skincare products that has built a reputation for its differentiated marketing approach and value-added partner programs. Through its commitment to research and development, RAI has brought to market products that leverage leading edge skincare technology to deliver breakthrough results for clients.

For the development of Lumière topical skincare products, scientists from PTL shared their expertise of LED light therapy with RAI's team of industry renowned cosmetic chemist. Together, knowledge of the biochemical process of LED light therapy combined with the latest in active ingredients and topical delivery systems have resulted in an exceptional line of skincare products specially formulated to work in conjunction with Lumière Photo-Thérapie.

Finally, a "franchise-type" model offering implementation, training and sales support is provided to business partners with the goal of accelerating their profitability while building a strong brand for Lumière Light Thérapie. A genuine spirit of partnership exists between our organizations and our partner providers.

It will be our pleasure to share additional details about Lumière Light Thérapie with you. We are looking forward to many opportunities for shared success between us.

Sincerely,

Susan D'Arcy
CEO, Photo Therapeutics Limited
